Sunlight Clinical Solutions combines four of the leading names in healthcare; Rocialle, Guardian, IHSS and Sunlight’s Protex to offer a comprehensive and integrated range of healthcare services and products.

In **safe** hands...

Sunlight Clinical Solutions leads the UK market for **custom procedure trays with its Rocialle range**. CPTs provide efficiencies that enable theatre teams to spend more time with patients, and reduce surgical site infections. The company is also a leading producer of dressing packs; each year more than thirty million Rocialle packs are produced in its medical clean room – the largest in the UK. On-site e-beam sterilisation enables flexibility and responsiveness when meeting healthcare customers’ requirements.

IHSS cleans and sterilises reusable instruments and other patient associated equipment from general hospitals, theatres and clinics. **IHSS has earned a leading position in the decontamination services market** by investing in the very latest in decontamination and sterilisation technology. The tailoring of its services to customers’ needs includes the supply of complimentary products from the Rocialle range of supplementarys such as dressing towels, polyware, swabs and bandages.
Sunlight Clinical Solutions presents healthcare organisations with comprehensive ranges of both multi-use and single use surgical textiles, all of which exceed the standards associated with the European Norm 13795. Protex multi-use drapes, gowns and tray wrap, made from hi-tech synthetic materials, are decontaminated and sterilised at facilities that process only surgical textiles. Over 20,000 gowns and 10,000 drape packs are processed each day.

Sunlight Clinical Solutions is Britain’s largest manufacturer of single use surgical textiles and the UK design and manufacturing centre enables a fast reaction to customers’ requests for speciality drapes. The Guardian range, manufactured from hi-tech synthetic materials, is designed to provide the surgical team with the highest levels of protection, comfort and quality.
The Sunlight Clinical Solutions facility in Ayrshire has been manufacturing single use surgical textiles for over 25 years.

The experience and skills established over that time have enabled the development of a range that exceeds the regulatory standards of EN13795, provides high levels of comfort and incorporates design features that contribute towards smooth and efficient surgery.

To ensure the highest levels of protection are provided to patients and surgical teams, the testing undertaken for the full range of products goes far beyond that required to satisfy the Medical Devices Directive. Market leading performance is confirmed by the testing of attributes including tensile strength, bursting strength, absorbency and spread, resistance to penetration and resistance to tearing.

The comfort of the surgical team and the patient is a crucial consideration in the design of the Guardian range: the surface of the drapes is made from viscose rather than polypropylene and so has a softer feel as well as providing improved absorbency and liquid control. Use of high tech synthetic materials in the construction of the gowns means high levels of protection are achieved without the need for excessive thickness and uncomfortable heat retention. For patients, a comfort layer is incorporated into drapes that are likely to be used in procedures of a longer duration. The entire range is latex free.
Attention to detail in the design and manufacture of the Guardian range is evident in the high level of protection and comfort provided. It is also seen in features of both the drapes and gowns. Colour coded collars and packaging help ensure selection of the gown that provides the correct level of protection for the procedure. Gowns are offered in four levels of protection allowing a more specific choice than just between High and Standard Performance.

Fluid pouches are manufactured as an integral part of the drape and made for strength and reliability from heavyweight, clear PE. Drainage ports are designed to minimise the risk of blocking. Drapes have resealable line holders which securely hold diathermy lines and suction tubing but provide flexibility - allowing lines to be released, repositioned and held again.
